

# **PriSMA: Priority Setting Tool for Mine Action**

Enhance the ability of mine action stakeholders and of partners in the broader human security sector **to improve clarity on the impact of hazards**, thereby leading to more informed and effective hazards reduction decisions

Setup criteria and data gathering / Completion / Testing with Operators (MAG, HALO Trust) Feedback reporting to GICHD / Identification of practical & technical issues and solved / Demonstration to Mine Action stakeholders and other interesting Professional Parties ( Academic)

<b>Criteria</b>	<b>Indicator</b>	<b>Spatial Data &amp; Attribute</b>	<b>Source</b>
Resettled population	No of Returnees & No of Settlement	Population/ Settlement locations/ Hazard Area	Census and Statistical / GAs/IMSMA
Hazardous areas between 0.5 kilometers to 1 km from villages, main roads and access roads , Water body , school	HA located within 0.5 km to 1km of settlements or roads, Water and other	Landuse data/ HA	Relevant Ministries/ Dept.
Land with essential infrastructure such as existing roads, electricity supply, water supply and irrigation systems	Proximity of the Infrastructure to HA	Spatial Data	Water Board/ RDA, CEB etc
Land where people conduct their livelihood activities	Proximity to Livelihood	Cultivated Area	Survey Dep.

Close Proximity to Settlement, School, Population and Water

Close Proximity to Settlement, School, Population and Water

## Results and Findings

**Application** – HA Prioritization considering Indicators ( population, settlements, schools and water)

Area – Killinocichci District

Hazardous Area – 17 sqkm

**Results** – High Impact visualized in red color while less impact in green and yellow respectively.

For example in the first map the population parameter was given a high weightage hence its result a red patch in the map. In the second map the water parameter is given a less weightage. As a result we can see a yellow patch in the second map, showing that depending on the weightage / prioritizing the results have changed.

## Close proximity to Settlement and Roads

Sri

Impact	Area size (Sqkm)
High	9
Medium	2
Less	6
<b>Total</b>	<b>17</b>

Variable	Proximity (m)
Settlement	700
School	700
Water	700
Main Road	200
Access Road	400

## Feedback

- User Friendly Interface
- Powerful tool for fast decision making
- Weighting methodology are quite easy
- Output and the analysis system are impressive
- All Results and accuracy depend on the spatial data quality
- As needed, indicators/ variables can be introduced and changed
- Need ground truth verification to have good results
- It is better to develop a standard weights to each parameter, in order avoid the different results from the different ground users.
